Why are there contaminants in my drinking water?

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity:

- microbial contaminant, such as viruses and bacteria, that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife
- inorganic contaminants, such as salts and metals, which can be naturally occurring or result from urban stormwater runoff, industrial, or domestic wastewater discharges, oil and gas production, or farming
- pesticides and herbicides, which may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses
- organic chemical contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come form gas stations, urban stormwater runoff, and septic systems
- radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities

Certain minerals are radioactive and may emit forms of radiation known as photons and beta radiation. Some people who drink water containing beta particle and photon radioactivity in excess of the MCL over many years may have an increased risk of getting cancer.

More information about contaminants and potential health effects can be obtained by calling the EPAs Safe Drinking Water Hotline at (800) 426-4791.

Town of Pierceton Water Department

Phone: 574-594-2213

E-mail: casey@pierceton.org

In order to ensure that tap water is safe to drink, EPA prescribes regulations that limit the amount of certain contaminants in water provided by public water systems. Food and Drug Administration (FDA) regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

Some people may be more vulnerable to contaminants in drinking water than the general population.

Contaminants may be found in drinking water that may cause taste, color, or odor problems. These types of problems are not necessarily causes for health concerns. For more information on taste, odor, or color of drinking water, please contact the system's business office.

Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline (800-426-4791).

Additional Information for Lead

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Pierceton Water Department is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at http://www.epa.gov/safewater/lead.

Consumer Confidence Report 2024

Is my water safe?

We are pleased to present to you the Annual Water Quality Report (Consumer Confidence Report) for the year, for the period of January 1 to December 31, 2023. This report is intended to provide you with important information about your drinking water and the efforts made by the water system to provide safe drinking water. (Este informe contiene informacion muy importante sobre su agua potable. Traduzcalo o hable con alguien que lo entienda bien).

How can I get involved?

Town Council Meetings are the Second Monday of the Month at 6:30 in the Community Building

Consumer Confidence Report

Sources of Drinking Water

Pierceton Water Works is Ground water

Our water source(s) and water assessment information are listed below:

Source Name	Type of Water	Report Status	Location		
WELL#1	EAST	Ground Water			
WELL#2	WEST	Ground Water			

Our water system tested a minimum of 2 samples per month in accordance with the Total Coliform Rule for microbiological contaminants. With the microbiological samples collected, the water system collects disinfectant residuals to ensure control of microbial growth.

Disinfectant	Date	Highest RAA	Unit	Range	MRDL	MRDLG	Typical Source
Chlorine	2023	1	ppm	0.3-0.7	4	4	Water additive used to control microbes

Regulated Contaminants

Our water system tested a minimum of 2 samples per month in accordance with the Total Coliform Rule for microbiological contaminants. With the microbiological samples collected, the water system collects disinfectant residuals to ensure control of microbial growth.

<u>Term</u>	<u>Definition</u>						
MCL	Maximum Contaminant Level: The highest level of a contaminant that is allowed in drinking water.						
Mice	MCLs are set as close to the MCLGs as feasible using the best available treatment technology.						
	With the set as close to the weeks as leasible asing the best available deather technology.						
MCLG	Maximum Contaminant Level Goal: The level of a contaminant in drinking water below which there						
	is no known or expected risk to health. MCLGs allow for a margin of safety.						
π	Treatment Technique: A required process intended to reduce the level of a contaminant in drinking						
	water.						
MRDL	Maximum Residual Disinfection Level: The highest level of a disinfectant allowed in drinking water.						
	There is convincing evidence that addition of a disinfectant is necessary for control of microbial						
	contaminants.						
MRDLG	Maximum Residual Disinfection Level Goal: The level of a drinking water disinfectant below which						
	there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of						
	disinfectants to control microbial contaminants.						
AL	Action Level: The concentration of a contaminant which, if exceeded, triggers treatment or other						
	requirements which a water system must follow.						
ALG	Action Level Goal: The level of a contaminant in drinking water below which there is no known or						
	expected risk to health. ALGs allow for a margin of safety.						
,Variances and Exemptions	State or EPA permission not to meet an MCL or a treatment technique under certain conditions.						
Level 1 Assessment	A Level 1 assessment is a study of the water system to identify potential problems and determine						
	possible) why total coliform bacteria have been found in our water system.						
Level 2 Assessment	A Level 2 assessment is a very detailed study of the water system to identify potential problems ar						
	determine (if possible) why an E. coli MCL violation has occurred and/or why total coliform bacteri						
	have been found in our water system on multiple occasions.						
Unit Descriptions							
Term	<u>Definition</u>						
Avg	Average - Regulatory compliance with some MCLs are based on running annual average of monthly						
	samples						
LRAA	Locational Running Annual Average						
ppm	milligrams per liter or parts per million - or one ounce in 7,350 gallons of water						
ppb	micrograms per liter or parts per billion - or one ounce in 7,350,000 gallons of water						
mrem	millirems per year (a measure of radiation absorbed by the body)						
picocuries per liter (pCi/L)	picocuries per liter is a measure of the radioactivity in water						
NA	not applicable						

Violations

During the period covered by this report we had the below noted violations.

Violation Period Analyte Violation Type Violation Explanation

No violations during this period.

Deficiencies

Unresolved significant deficiencies that were identified during a survey done on the water system are shown below.

Date Identified	Facility	Code	Activity	Due Date	Description

No deficiencies during this period.
